Office Action Summary

Art Unit: 2834

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Harnden (118)

or Ohba.

Ohba (fig. 2) shows a substrate carrying a contact #15a and a moveable contact #13a with the moveable contact being connected to piezoelectric activator #1. Harnden (118) figs. 4 and 6 teaches similar structure. In fig. 6, the moveable contact #646 is deposited on the piezo element. These references don't explicitly teach using a deposited piezo element. However, each of Kompanek, Higgins and Mariani teach it is well known to use a deposited piezo element to drive a moveable member. It has long been held that selection from among known materials is within the skill expected of the routineer. Thus to use a deposited piezo element, especially if miniaturization is a desired goal, would have been obvious to one of ordinary skill in the art.
